why we Use Code first rather than DBfirst?

Because in code first :

1- We only use pure c#
2- Pure OOP (better in mapping/relations as u can use inheritance or else)
3- We can convert it into any database management system using provider
4- Maintainability , versioning using migration as it tracks schema changes

---

Why we use Fluent API over than Data Annotations?

Because in fluent API :

1- Advanced configurations
2- Separation of concerns (you can keep the configuration outside the entity class)
3- No source code modification (in real life you are likely wont have access to the source code so you wont be able to use annotations and your only way is to use fluent API)
